

# **UPTIME Project Overview**

**Digital Platforms in Manufacturing**

**Brussels, 5-6 Feb. 2018**

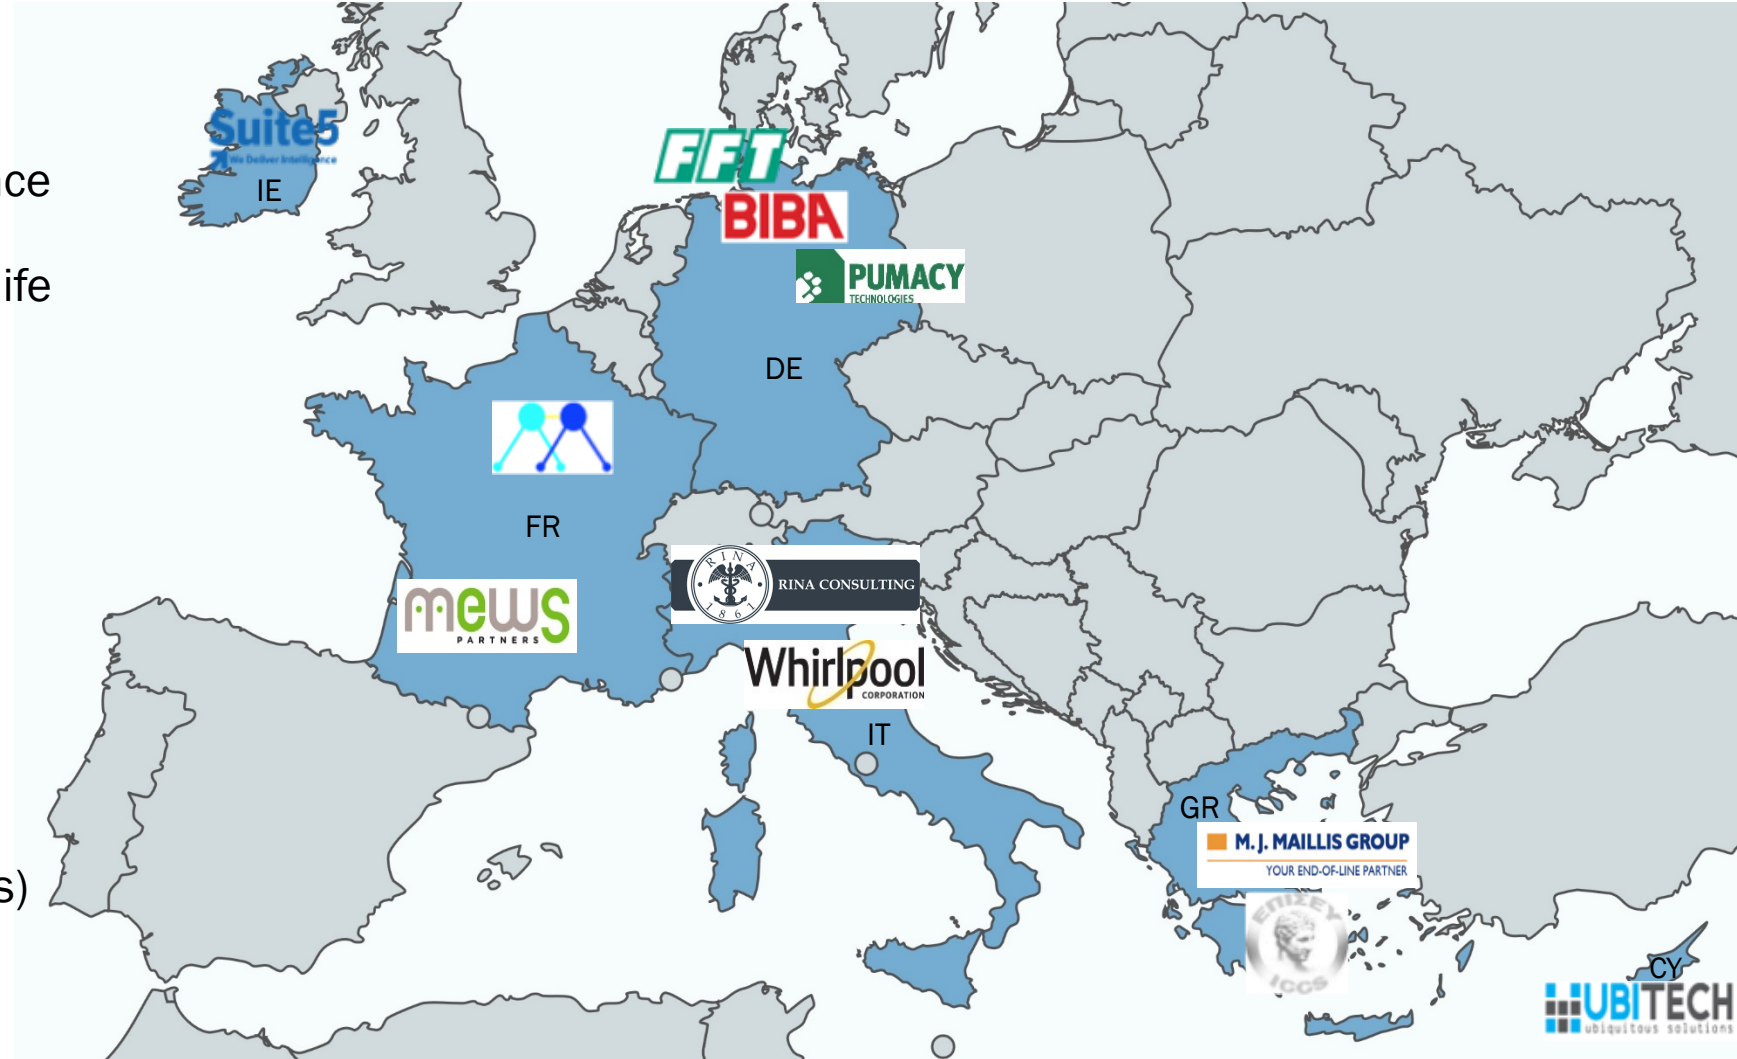

Horizon 2020  
European Union Funding  
for Research & Innovation

Prof. Gregoris Mentzas, ICCS

# General Information

- Topic: FOF-09-2017  
Novel design and predictive maintenance technologies for increased operating life of product systems
- Type: IA
- Duration: 36 Months
- Start date: 01.09.2017
- End date: 31.08.2020
- Project cost: € 6,248,367.50
- Max grant: € 4,847,836.25  
(77.59% of total costs)

- Existing maintenance strategies can be broadly distinguished in 3 categories:
  - (a) breakdown maintenance;
  - (b) time-based, preventive maintenance;
  - (c) condition-based, predictive maintenance
- Condition monitoring is increasingly realized with equipment-installed sensors
  - such as vibration analysis, thermography, acoustic emissions, etc.
- Sensors have the capability of measuring with high frequency a multitude of parameters leading to processing and storage of a huge amount of data
- Recent developments lead to a new predictive maintenance approach providing powerful capabilities for physical understanding of the useful life of a system
  - through dynamic pattern recognition in various available data sources

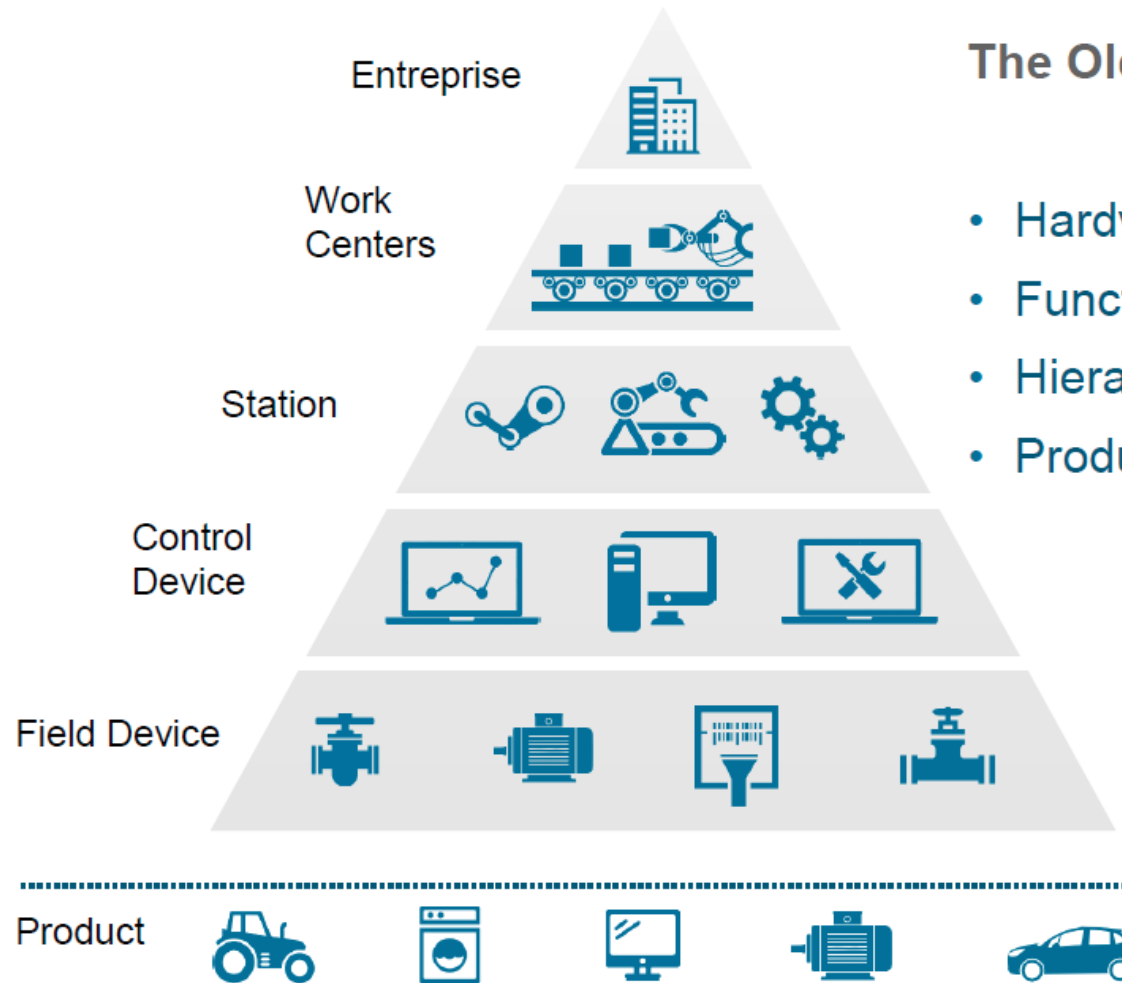

# The vision of UPTIME

- To reframe predictive maintenance strategy in a systematic and unified way by exploiting research advances in three main areas:
- Industry 4.0:
  - I4.0 paves the way for extensive use of physical and virtual sensors generating a multitude of data.
- Big Data processing
  - Availability of big data leads to a strong demand for data-driven, real-time systems incorporating efficient processing technologies in order to get meaningful insights about business performance.
- Proactive Computing
  - Proactive event-driven computing is referred to the use of event-driven systems for mitigating future undesired events or for taking advantage of future opportunities.

# Industry 4.0: From the “old” industry...

## The Old World: Industrie 3.0

- Hardware-based structure
- Functions are bound to hardware
- Hierarchy-based communication
- Product is isolated

Source: Plattform Industrie 4.0

# Industry 4.0: ... to the “new” industry

## The New World: Industrie 4.0

- Flexible systems and machines
- Functions are distributed throughout the network
- Participants interact across hierarchy levels
- Communication among all participants
- Product is part of the network

Breadth and frequency of data

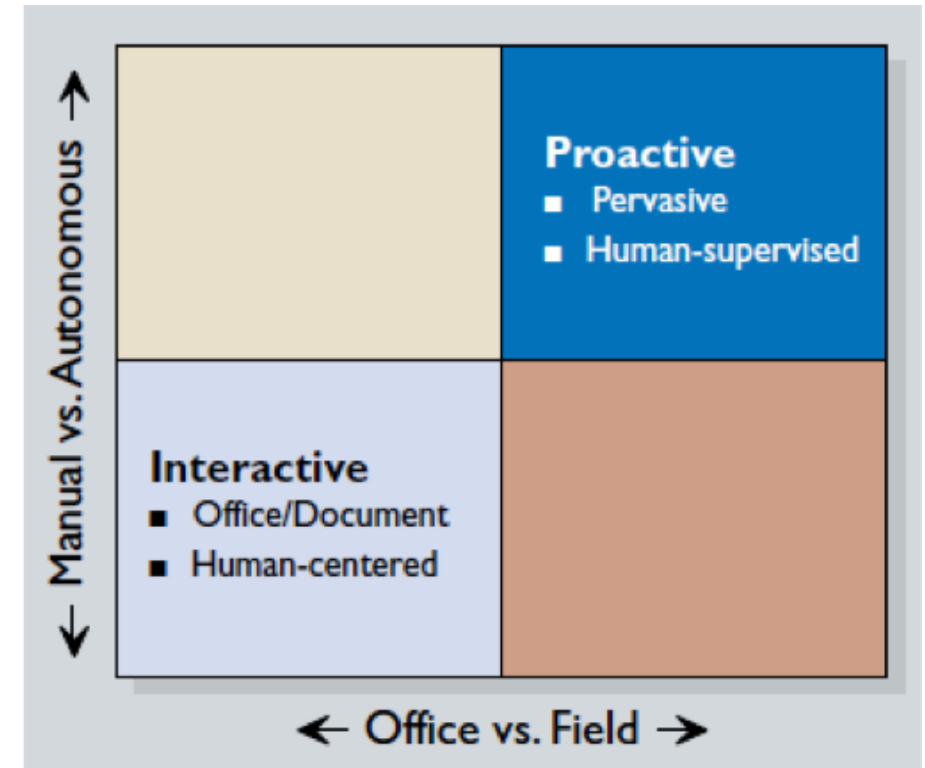

# Proactive Computing: The basics

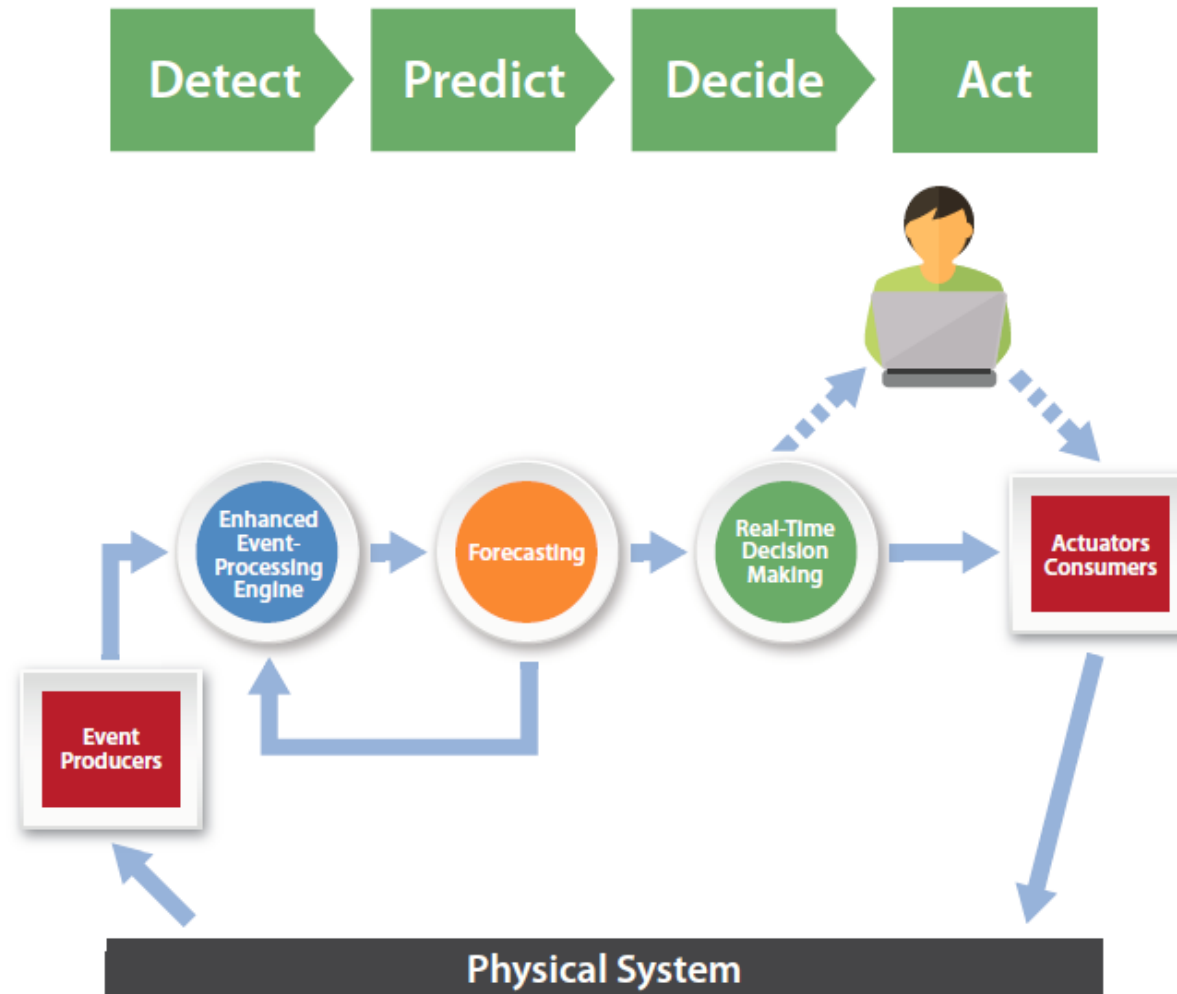

- Getting **physical**
  - Proactive systems will be intimately connected to the world around them
    - using sensors and actuators to both monitor and shape physical surroundings
- Getting **real**
  - Proactive computers will routinely respond to external stimuli
    - at faster-than-human speeds.
- Getting **out**
  - Interactive computing deliberately places human beings in the loop
  - New proactive modes of operation put humans “above the loop”, into supervisory and policy-making roles

- Proactive information systems aim to enable business analysts to create and configure decision method instances for mitigating a **future undesired event**, which lays outside the desired states space.
- Based on the **predictions** for undesirable situations derived on the basis of streaming data, decision methods instances are enacted online to generate mitigating **action recommendations** and optimal time of **action implementation**.

## The UPTIME Approach

# UPTIME: Integrating five research results

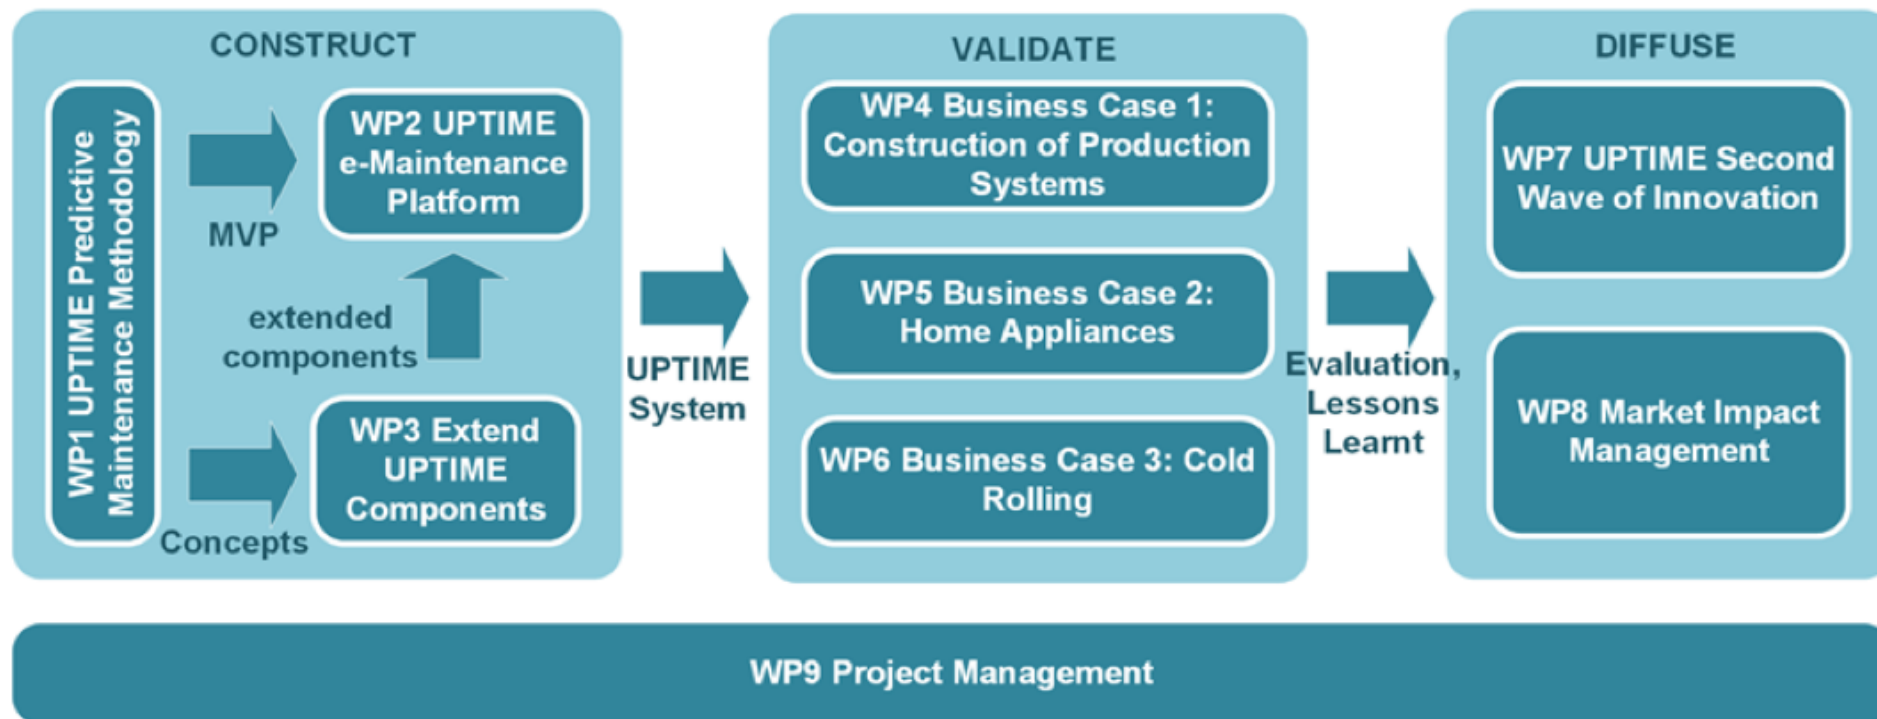

- USG (BIBA) serves as a modular data acquisition and integration device
- preInO (BIBA) is able to detect and predict the state of a whole system
- PANDDA (ICCS) provides proactive recommendations about maintenance actions and the time for their implementation
- SeaBAR (PTA) supports end users by means of data aggregation, data analysis and visualization
- DRIFT (DAPP) uses data to identify what are the Failure Modes, Effects and Criticalities

# Objectives and Implementation Approach

- **OBJ1:** **Extend** and **unify** the new digital, e-maintenance services and tools in order to exploit the full potential of a predictive maintenance strategy with the UPTIME solution
- **OBJ2:** **Deploy** and **validate** the UPTIME solution in manufacturing companies
- **OBJ3:** **Diffuse** the UPTIME Solution in the manufacturing community

# Business Cases

Home Appliances /  
White Goods:  
Automatic Drum Line

Steel Industry:  
Cold Rolling Mill Lines

Construction of production  
systems:  
Intelligent Maintenance of  
tools, jigs and fixtures

# Thank You!

*This project has received funding from  
the European Union's Horizon 2020  
research and innovation programme  
under grant agreement No 768634*

- **Objective:** Novel design and predictive maintenance technologies
- **Topic:** FoF-09-2017
- **Call:** H2020-FOF-2017
- **Lead:** BIBA – Bremer Institut für Produktion und Logistik GmbH
- **Duration:** 36 Months
- **Start:** 2017/09

### **Predictive Maintenance in Industry 4.0: Methodologies, Tools and Interoperable Applications**

Workshop co-located with the  
I-ESA '18 INTEROPERABILITY FOR ENTERPRISE SYSTEMS AND APPLICATIONS CONFERENCE  
20-21 March 2018, Berlin

**The submission deadline of paper abstracts for all I-ESA 2018 workshops  
has been extended to February 15, 2018 (firm deadline) at the request of the authors**

Workshop within  
i-ESA 2018  
19-23 March 2018

Maintenance is a key operation function within manufacturing enterprises related to all of their processes and focuses not only on avoiding the equipment breakdown but also on improving business performance. In the last years, due to the evolution of technology, products and machines have become more and more complex. Consequently, the costs of time-based (planned) maintenance have increased and predictive maintenance has evolved as a novel lever for maintenance management. To this end, the emergence of the Internet of Things (IoT) can enhance the condition monitoring capabilities by paving the way for extensive use of physical and virtual sensors generating a multitude of data. In this way, predictive maintenance can significantly evolve in the frame of Industry 4.0. Industry 4.0 indicates the flexibility that exists in value-creating networks which enables machines and plants to adapt their behaviour to changing orders and operating conditions through self-optimization and reconfiguration with the aim to implement distributed and interconnected production facilities in future smart factories.

The Workshop aims to promote and encourage research and industrial efforts with the aim to cover a number of topics related to methodologies, concepts, architectures, tools and interoperable applications for predictive maintenance in the frame of Industry 4.0. The main goal of this workshop is to provide a forum for researchers and practitioners with diverse backgrounds to meet, exchange research and implementation ideas, and share experience and results regarding predictive maintenance within the Industry 4.0 paradigm.
